cids encoding them. PRIN is used as vaccine and in gene therapy. PRIN is used in the prevention, diagnosis and treatment of diseases cancers, adenorarized line, leavention, diagnosis and treatment of diseases cancers, adenorarized line prevention, diagnosis and treatment of diseases cancers, adenorarized line prevention, surcoma, immune disorder, Addison's disease, acquired immune deficiency syndrome (AIDS), anaemia, asthma, allergies, gout, microbial infections, cardiovascular disease and/or inflammation, myasthenia gravia, atheroselerosis, cirrhosis, osteoproresis, mycoardial infarction, cataract, disease, lipid disorder, seizure disorder, pulmonary embolism, daucher's disease, ilpid disorder, ipid storage disease, pick's disease, Tay-Sachs disease, renal disease and obesity.

FRIN may be used to treat disorders associated with decreased PRIN expression by rectifying mutations or deletions in a patient's genome that affect the activity of PRIN by expressing inactive proteins or to supplement the patients own production of PRIN. PRIN nucleic acids into used to produce the PRIN polypeptide, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. PRIN nucleic acids and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar control and control of prince the presence of similar may need of restorative therapy. The present sequence is human PRIN-II
seizure disorder; pulmonary embolism; Gaucher's disease; lipid disorder; lipid storage disease; Pick's disease; Tay-Sachs disease; renal disease; obesity; restorative therapy; immunomodulatory; vaccine; cardiovascular; antimicrobial; cytostatic; antiinflammatory; asthma; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nucleic acids, useful for preventing diagnosing and inflammation and immune disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to human kinases (PKIN) and the nucleic acids encoding them. PKIN is used as vaccine and in gene therapy. PKIN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;
                                                                                                                                                                                                                                                                                                                                                             The present sequence encodes a kinase polypeptide. The kinase polynucleotides and polypeptides are useful in therapeutic, diagnostic and pharmacogenic applications. They are useful for the detection of mutant kinases, or inappropriately expressed kinases for the diagnosis of a disease or disorder. They are useful for screening for drugs (or high throughput screening of combinatorial libraries) effective in the treatment of symptomatic or phenotypic manifestations of that disease or disorder. The polynucleotide sequence is useful as a source of probes and primers, which can be used to screen libraries, isolate
                                                                                                                                                                                                                                                                             Novel isolated human kinase polynucleotide that shares structural similarity with animal kinases including calcium/calmodulin-dependent protein kinases and serine/threonine protein kinases, useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  242

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             3
                                                                                                                                                                                                                                                                                                                      The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity, chemotactic/chemokinetic activity, heamostatic and thrombolytic activity, chemotactic/chemokinetic activity, heamostatic and thrombolytic activity, arthritis and inflammation, leukaemias and

                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to human kinases (PKIN) and the nucleic acids encoding them. PKIN is used as vaccine and in gene therapy. PKIN is used in the prevention, diagnosis and treatment of diseases cancers, adenocarcinoma, leukemia, sarcoma, immune disorder, Addison's disease, adenocarcinoma, leukemia, sarcoma, immune disorder, Addison's disease, acquired immune deficiency syndrome (AIDS), anaemia, athma, allergies, gout, microbial infections, cardiovascular disease and/or inflammation, myasthenia gravis, atherosclerosis, cirrhosis, osteoporosis, myocardial infaction, cataract, growth and development disorder, lipid storage infarction, cataract, growth and development disorder, seizure disorder, glassase, Pkick's disease, renal disoraer, seizure disorder, pkin may be used to treat disorders associated with decreased pkin.

Cexpression by rectifying mutations or deletions in a patient's genome that affect the activity of PKIN by expressing inactive proteins or to supplement the patients own production of PKIN, PKIN nucleic asset to produce the PKIN polypeptide, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. PKIN nucleic acid and its complementary sequences may also be used as DNA probes in nucleic acid sequences in samples and therefore which patients may be nucleic acid sequences in samples and therefore which patients may be need of restorative therapy. The present sequence is human PKIN-2 cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        7

                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM3642-AAM4213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic assays for receptor activity, arthritis and inflammation, leukaemias and chromotars.

                                                                                                                                                                                          ö
                                                                                                                                     AASO6701-AASO6757 encode for novel human protein kinases #1-57. The novel protein kinases have been identified as members of the tyrosine or serine/threonine kinase (PTK and STK) families. The polynucleotides encoding protein kinases and the polypeptides may be used in the prevention, diagnosis and treatment of diseases associated with imappropriate kinase expression. For example, they may be used to treat cancers (especially cancers of hematopoletic origin), cardiovascular disease (e.g. atherosclerosis), metabolic disorders (e.g. diabetes), immune related diseases (e.g. rheumatoid arthritis), neurological disorders (e.g. schizophrenia), neurodegenerative disorders (e.g. parkinson's disease), inflammatory disorders (e.g. infertility). Additionally, polynucleotides encoding protein kinases may be used as of antibodies against the protein kinases and in assays. The protein kinase polypeptides may be used as antigens in the production of antibodies against the protein kinases and in assays to identify modulators of protein kinase expression and activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

The present sequence encodes a kinase polypeptide. The kinase polynuclectides and polypeptides are useful in therapeutic, diagnostic and pharmacogenic applications. They are useful for the detection of mutant kinases, or inappropriately expressed kinases for the diagnosis of a disease or disorder. They are useful for screening for drugs (or high throughput screening of combinatorial libraries) effective in the treatment of symptomatic or phenotypic manifestations of that disease or disorder. The polynucleotide sequence is useful as a source of probes and primers, which can be used to screen libraries, isolate clones, and prepare cloning and sequencing templates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              426

```

```
The present sequence encodes a kinase polypeptide. The kinase polynucleotides and polypeptides are useful in therapeutic, diagnostic and pharmacogenic applications. They are useful for the detection of mutant kinases, or inappropriately expressed kinases for the diagnosis of a disease or disorder. They are useful for screening for drugs (or high throughput screening of combinatorial libraries) effective in the treatment of symptomatic or phenotypic manifestations of that disease or disorder. The polynucleotide sequence is useful as a source of probes and primers, which can be used to screen libraries, isolate clones, and prepare cloning and sequencing templates.

The present sequence is the coding sequence for Murine Dendritic Cell Kinase 3 (MDCK-3). The protein encoded by the present sequence is useful for treating a variety of disorders listed in the disclosure of the specification, including autolimmune disorders, allergic reactions, myeloid or lymphoid cell deficiencies, wound healing and tissue repair and replacement, burns, inclsions and ulcres, periodontal disease, inflammatory diseases, tumours and bacterial, viral or fungal infection. MDCK-3 is a member of the Ca2+/calmodulin-dependent kinase family.

source anonymous pool of 6 male brains, age range 23-27; I
male lung, age 27; and 1 male testis, age 69. Library is
oligo-dT primed and directionally cloned (Eroxv site is
destroyed upon cloning). Average insert size 1.8 kb,
insert size range 1-3 kb. Library is normalized and
enriched for full-length chones and was constructed by C.

Library is oligo-dr primed and directionally cloned (ECORV site is destroyed upon cloning). Average insert size 1.4 kb, insert size range 0.9-4 kb. Library is normalized and enriched for full-length clones and was constructed by C. Gruber (Invitrogen). Research Genetics tracking code 012.
